Updated SMEFT global analysis

- Updated global SMEFT analysis in Higgs and EW sector
 - Added μ Yukawa correction + chromomagnetic operator
 - Added new measurements: high invariant mass distributions + Higgs
- Using the SFitter framework for global analysis
- New ways to construct likelihoods: marginalization
 - Previously used: profiling

Two different ways to treat statistics

Which one to choose?

Profiling

- Looking for maximum of the parameter space
- Profiled likelihood:

$$\max_T \mathcal{L}(M|T)$$

Marginalization

- Integrating over parameter space
- Marginal probability:

$$\int_T p(T|M) = \int_T \mathcal{L}(M|T) \frac{P(T)}{P(M)}$$

⇒ The method to be chosen depends on the question asked

Introduction

Profiling and marginalization

For the old data set

For the new data set

Comparing both data sets

High luminosity LHC

Conclusion

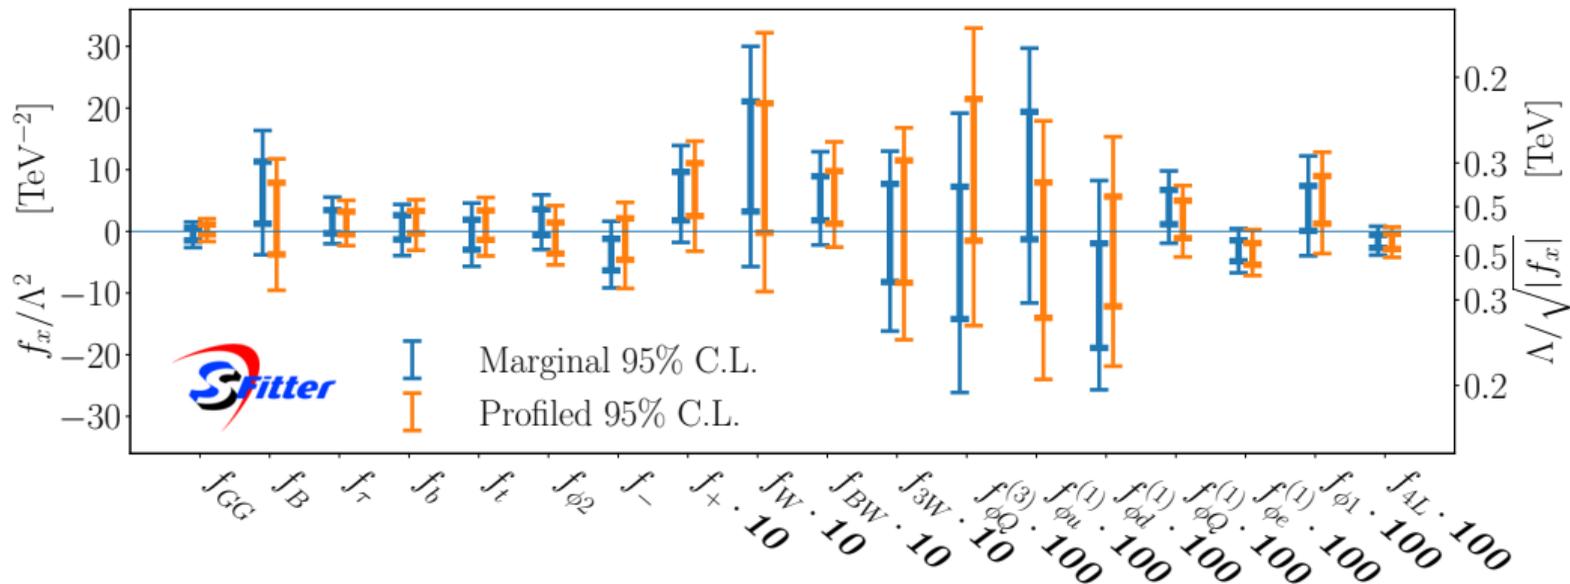

Low kinematics constrain non-kinematically enhanced operators [Butter et al.: 1604.03105; Biekötter, Corbett, Plehn: 1812.07587]

- Higgs measurements at LHC (275)
- Di-boson measurements at LHC (43)
- Electroweak Precision Observables at LEP (14)

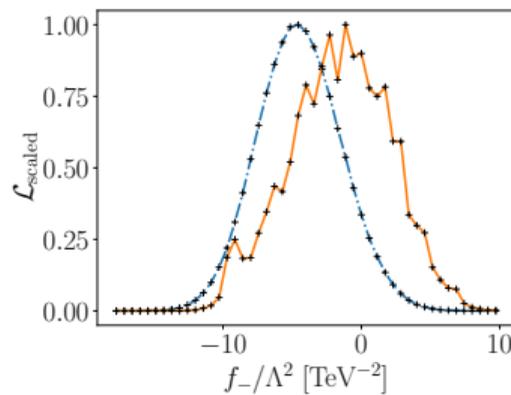

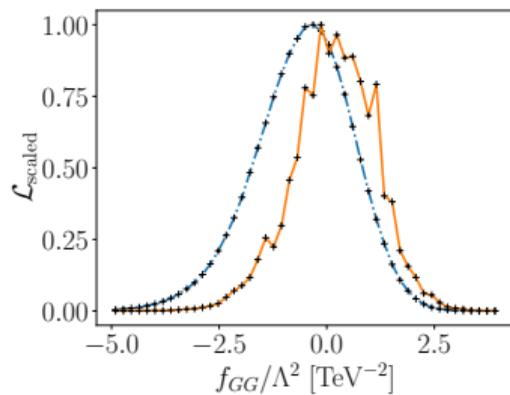

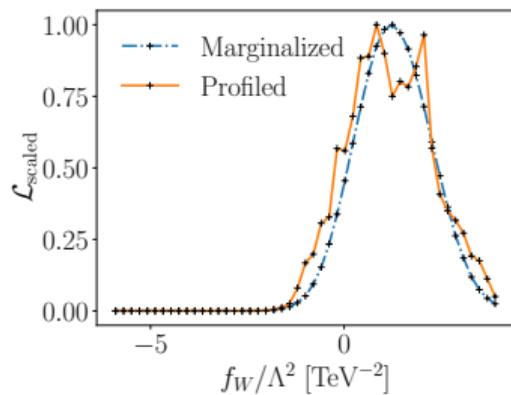

High kinematics constrain kinematically enhanced operators

- VH resonance search by ATLAS [1712.06518]

No big difference for the old data set

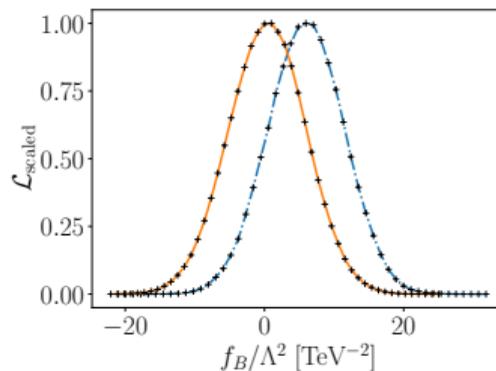

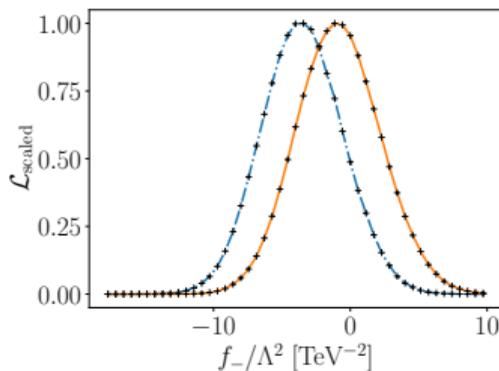

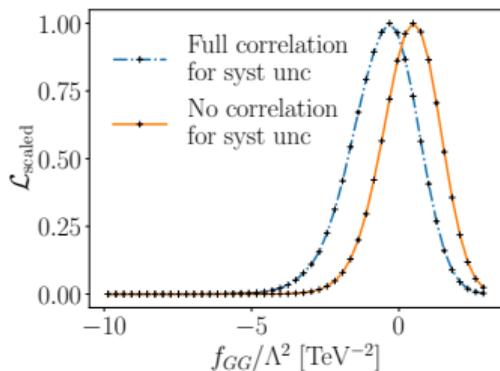

They are the same - aren't they?

- Comparable results for both methods
- **Small shifts** in the peak

Correlations are "game changers"

- Correlating systematic uncertainties
 - Correlations have an impact on the peak
- Responsible for **shifting the distribution**

Introduction

Profiling and marginalization

For the old data set

For the new data set

Comparing both data sets

High luminosity LHC

Conclusion

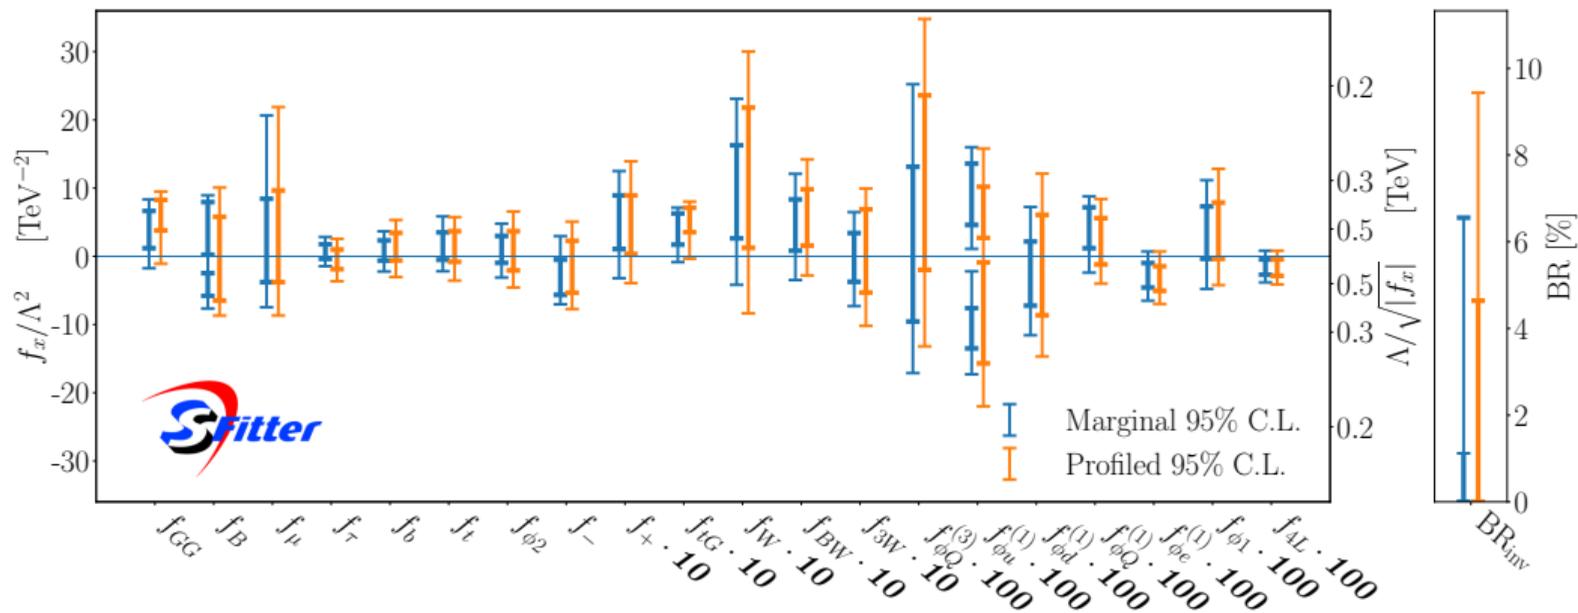

Low kinematics constrain non-kinematically enhanced operators [Butter et al.: 1604.03105; Biekötter, Corbett, Plehn: 1812.07587]

- Higgs measurements at LHC (275) + new Higgs (36)
- Di-boson measurements at LHC (43)
- Electroweak Precision Observables at LEP (14)

High kinematics constrain kinematically enhanced operators

- VH resonance search by ATLAS: ATLAS-CONF-2021-026 and 2007.05293
- VV resonance search by ATLAS: 2004.14636
- ZH resonance search by CMS: 2102.08198
- Higgs p_T analysis by ATLAS: ATLAS-CONF-2019-029

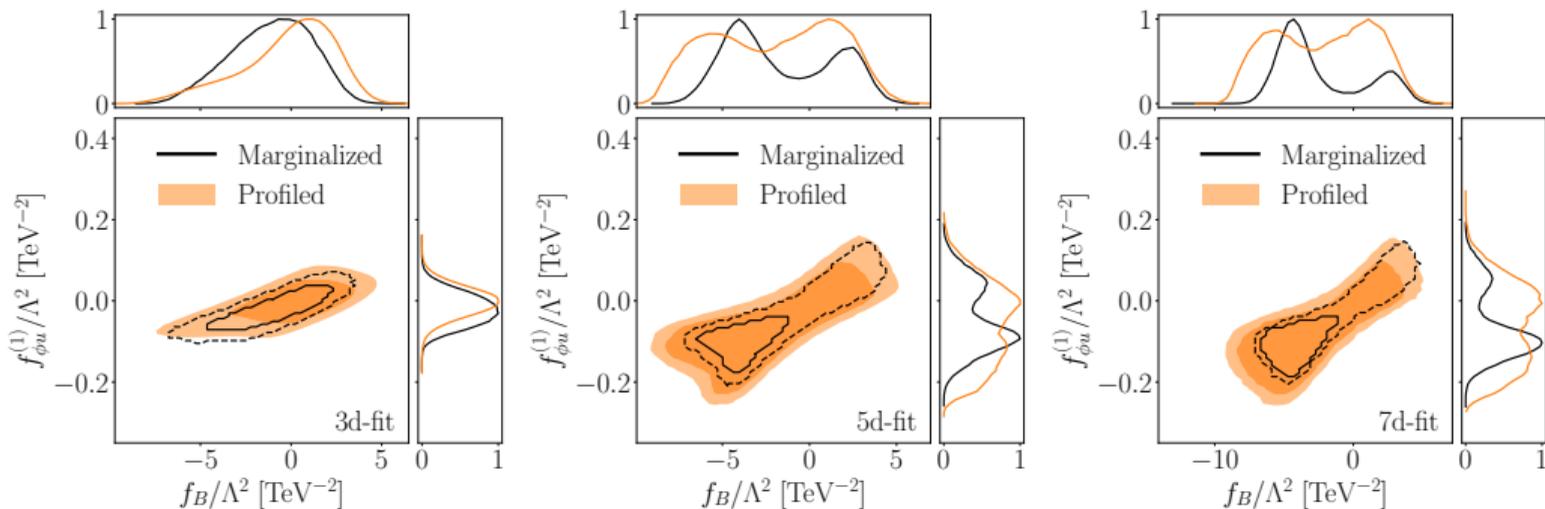

Differences for the new data set

The unexpected volume effect

- Peak structure appears with higher dimensional fits
- Need enough dimensions to accommodate underfluctuations (high kin. dist.)
- More coefficients \Rightarrow larger **volume effect**
Strengthen limits on coefficients (marginal case only)

Today's Agenda

Introduction

Profiling and marginalization

For the old data set

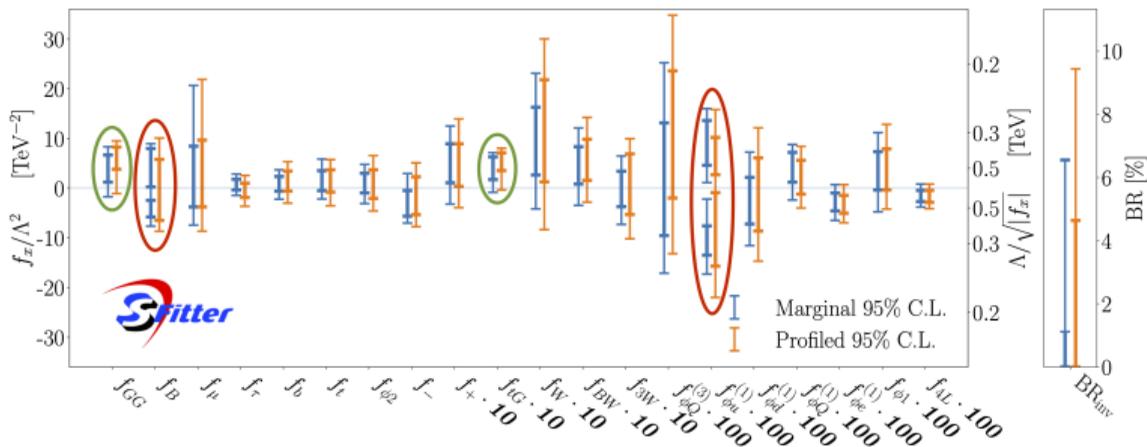

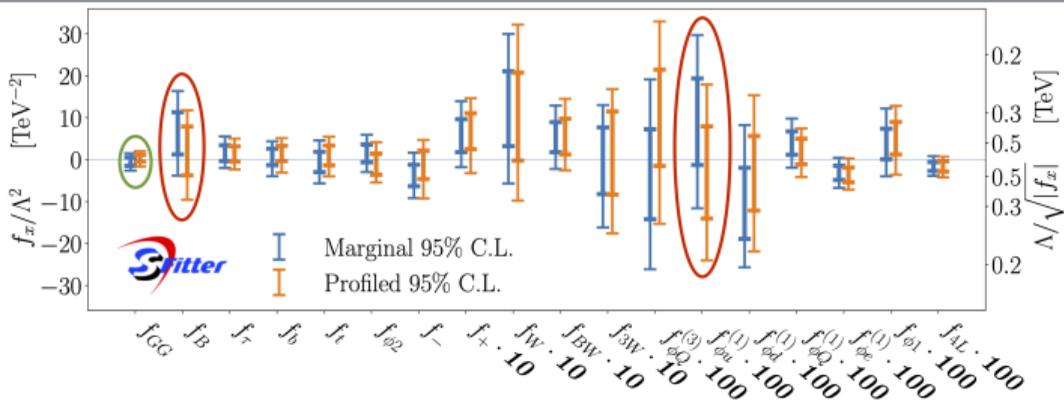

For the new data set

Comparing both data sets

High luminosity LHC

Conclusion

Comparing the results of both data sets

Today's Agenda

Introduction

Profiling and marginalization

For the old data set

For the new data set

Comparing both data sets

High luminosity LHC

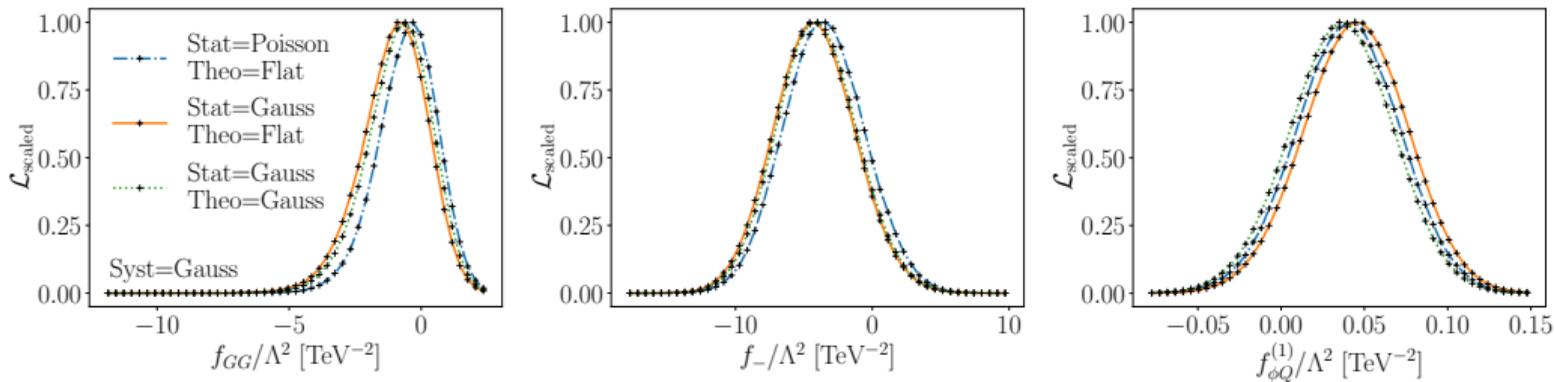

Conclusion

- Choose between profiling and marginalization
- They are not the same, but you **might not see it at a first look**
 - Results might look similar for highly-Gaussian data set
 - Results can look completely different for another data set
- Strong uncertainty treatment
- **First SMEFT tool** to combine these abilities

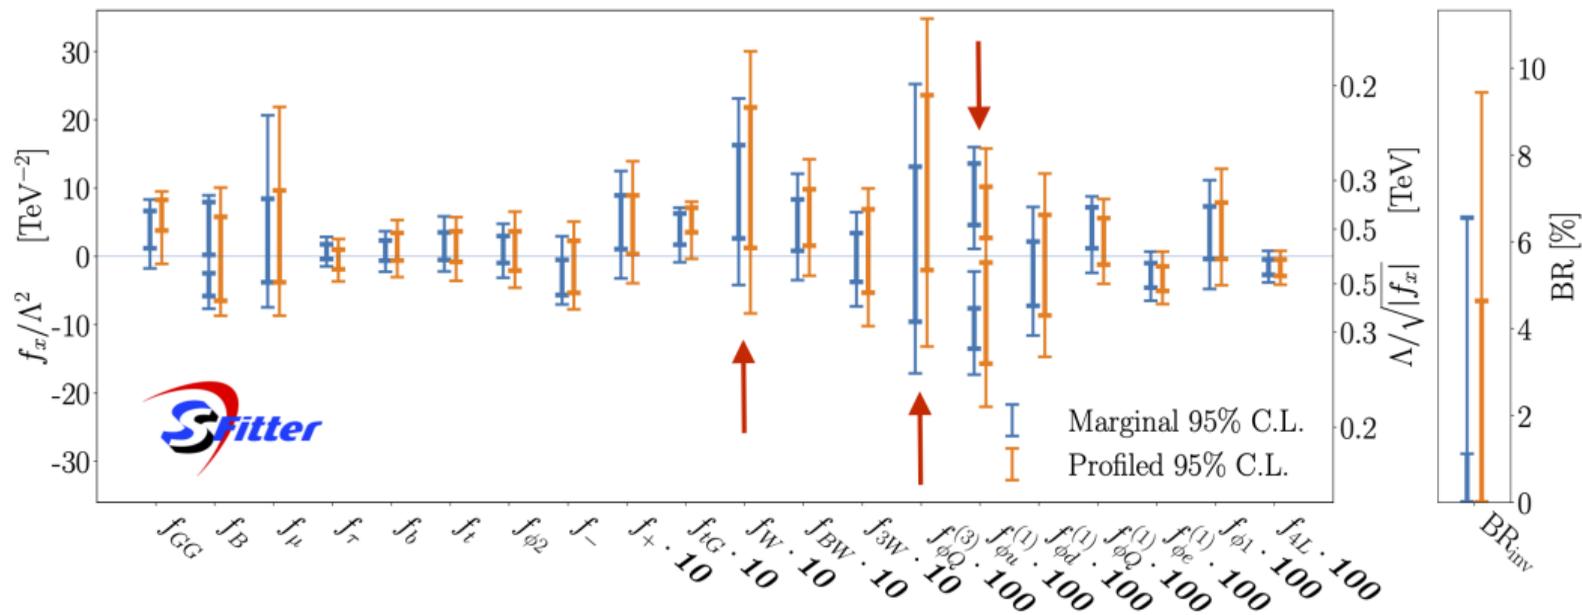

Backup slides

The rather small impact of theory uncertainties

- Consider different distributions for theory and statistical uncertainties
 - Systematic uncertainties are always Gaussian distributed
- **Little to no impact** on the overall distribution

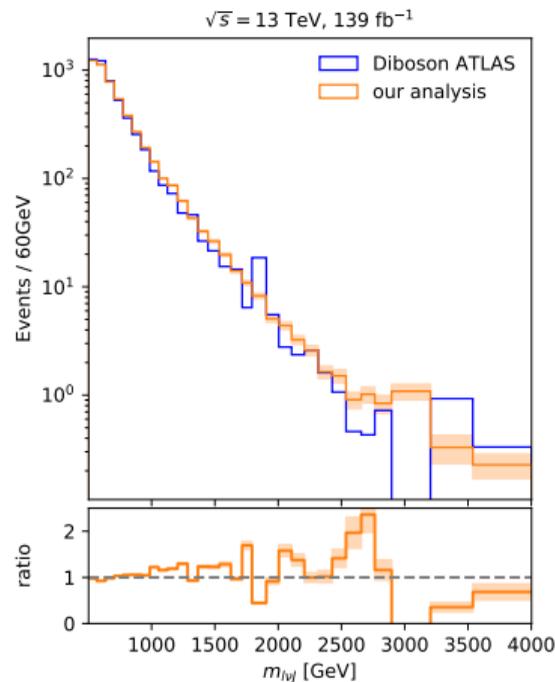

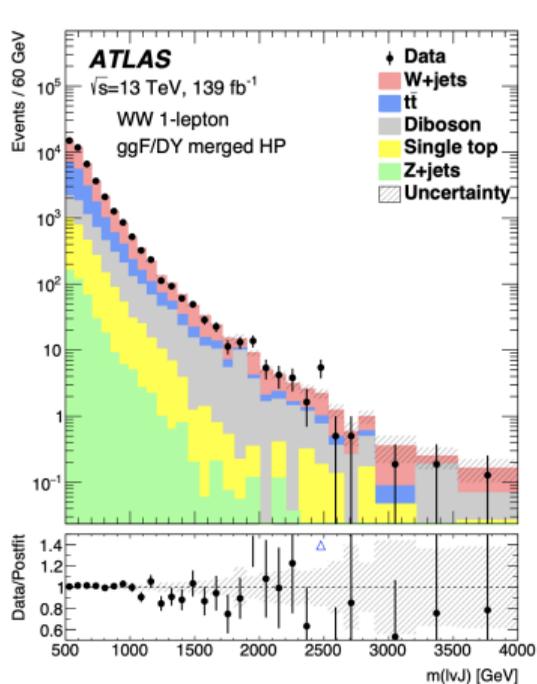

Differences for the new data set

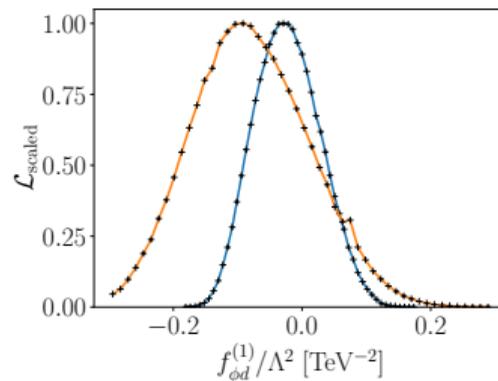

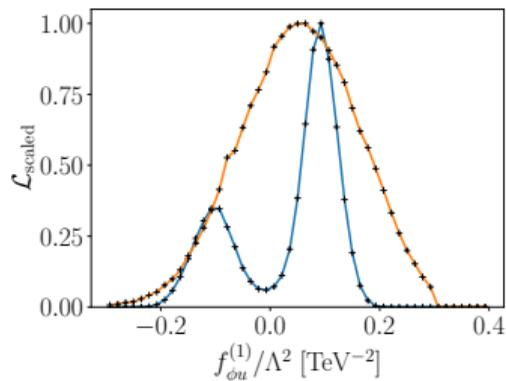

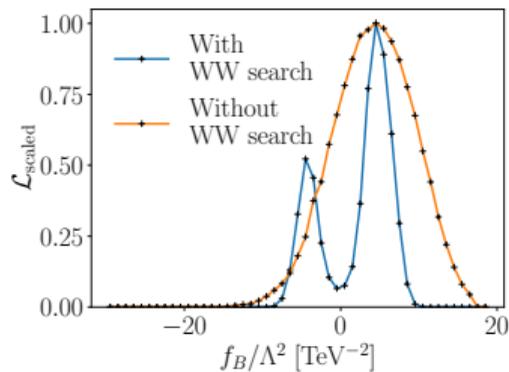

WW as one of a driving measurements

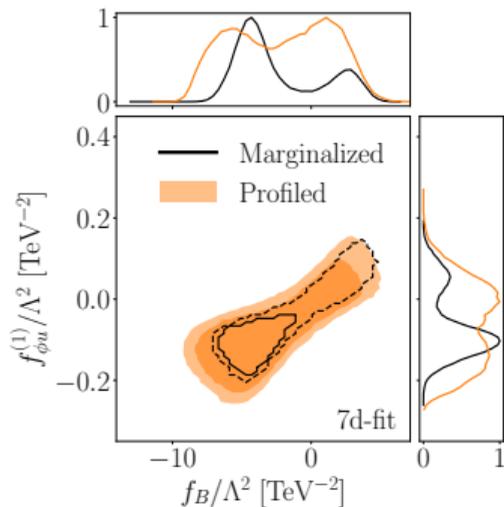

- Data set includes **high kinematic distributions**
- Driving measurement in linked coefficients
- Originally used for resonance searches

Influence of WW measurement on two modes

The problem with two modes

- Clear difference between both methods
- Because of the **two mode structure**
- Likelihood peaks are not on same level

Interplay of f_{GG} and f_{tG}
